I'm not advocating anyone to buy options, I've seen a 100k portfolio turn to dust in gme calls live lol. I'm curious what the case will be for those holding calls when that day comes though, what the chain as a whole will look like, and how shorts and or other institutions will be affected and their involvement in it. Intrinsically they should be worth 100 shares each minus the cost to exercise. For example gme at 10k, a call with a strike of \$100 would be worth 990k intrinsically. Will there be any volume on these...? Or say they're sold by holders lower than the intrinsic value, I'm assuming it'll be instantly purchased by some person or entity since it's really free money to take it off the sellers hands if they can sell or exercise it.

Are there any past stocks that have squeezed say even thousands of dollars with an options chain that I could refer to? Not sure where I'd even find that data if there has been one though

Just curious about everyone's thoughts as I haven't seen it discussed often. Personally holding a few long dated deep OTM for the fun of it and to see what happens.
