So if you look at the chart exchange post you'll see we have been at 65-70% short volume. Now days to cover post have been showing all time highs of 15-16 days.

Now here is where it gets funny well use 3 million dollars to represent the daily volume which could be inflated buy short open and short close with no difference to short positions beyond resetting clock.

So remove 65%volume gives 1,050,000 a day which would throw days to cover at around 48-50 trading days or ten weeks or 2 and a half months before they get out of shorts. Insert maniac laughter -'get out without shorting more' gme
