Hello fellow apes, I'm kind of confused what's the hype about pushing direct registered shares to 100% float, I did a simple drawing with computer crayons and hope one of you can shed some light on this.

[Buy, HODL, DRS!](<https://preview.redd.it/wo8v8b354dp91.png?width=360&format;=png&auto;=webp&s;=6cebc43e1d631cb1f45a30f5515a078634994dc7>)

To keep the scenario simple, say there's only one available GameStop share, and it's owned by "Share holder A", but then the share is borrowed by the "Shorter" and sold to "Share holder B". I'm not talking about synthetic shares or anything like that, just normal, legal short.

1. At this instance, what's the retail ownership percentage?
2. If "Share holder A" direct registered his share, that means 100% float is locked? But DRS doesn't close short positions, so there's still one share held by "Share holder B"?

Thanks for your time!
