

Title: Cycle Update: If the average cycle holds, a price increase could start today (10/4) or tomorrow

Good morning my dear apes,

A while ago I calculated the average cycles of our beloved GME to see if price movements can be estimated by it. This and the last posts are in no way an animation to (day)-trade GME but should only serve as an overview. My motto has always been: Buy, Hold, DRS.

Here is the post with the calculation of the average:

[https://www.reddit.com/r/Spielstopp/comments/ugtyx5/wenn_der_preistrend_bisher_weiterhin_bestand_hat/](https://www.reddit.com/r/Spielstopp/comments/ugtyx5/wenn_der_preistrend_bisher_weiterhin_bestand_hat/)

I then applied this average cycle and it was right on the day (which of course can be absolute coincidence, but it looks like the average at least gives a good overview). Here's the post about it:

[https://www.reddit.com/r/Spielstopp/comments/uxjuuq/cycle_update_wenn_der_durchschnitt_der_letzten/](https://www.reddit.com/r/Spielstopp/comments/uxjuuq/cycle_update_wenn_der_durchschnitt_der_letzten/)

For the current time, I see 3 possible scenarios:

****Scenario 1 average cycle:****

If we assume that the average cycle continues, i.e. after a regional peak within 40 trading days and about -60-65% price loss, today would be the last day of the downtrend or the first day of the price rise. The phases of the price rise usually last 20 trading days with a price rise of 2x 50% or 2x 150% and 1x 112% so far.

[Average cycle has the duration of 40 trading days \(\ends today\)](<https://preview.redd.it/2q05uevr2rr91.png?width=1606&format=png&auto=webp&s=dc8af173e97dfa1dacec083f2d8bf7a4c0cded28>)

****Scenario 2 extended cycle:****

The chart has very strong similarities with the last extended downtrend. Potentially we repeat this one. It looks like we only need 75% of the time this time (from the 1 highest peak to the first regional low, of all things). With the same ratio the second regional low would be on 05.10 so tomorrow. The downtrend is however clearly weaker with this run and/or GME is clearly stronger. Until the last (and the last time lowest) regional low it would take until 09.11 if the 75% duration is observed. So possibly like last time arcing first a rise and then again a bit down. From low 2 to low 3 last time it was about -10% that could potentially take us to about 22usd around 09.11. I think in the worst case we hold support at around 19usd.

[extended cycle](<https://preview.redd.it/2at85n9t2rr91.png?width=1540&format=png&auto=webp&s=4fbcab8dcf5bbfd7bd104a8978b5c4bf0987fb7>)

****Scenario 3 none of the above! :****

From the past one can never predict exactly the future. It can come naturally completely differently. The whole thing is also very dependent on the general market and news such as marketplace release. We will see what happens. In any case, I am very excited and good things :)

Disclaimer:

The content of this post is not investment advice and I am not an investment advisor. It is a simple attempt to find patterns using elementary school math.

P.S. i hope i didnt butcher your american date in the title :D

As always, buy, hold, DRS!
