Hey, I can't post on Superstonk but I am interested in the security of the eth block chain and if Gamestop is active around the development in the ETH ecosystems.

Since as I understand block chains while being in mining phase they are most vulnerable by process capacity or exploiting user directly.

But ETH moved from mining to proof of stake so that new transactions are verified by staking coins, as I recall.

The marketplace is build upon layer 2 (a protocol build on the eth block chain) is it necessary for Gamestop to hold eth and stake eth to secure the marketplaces and it's integrity or are the immutable and looping coin transactions noticed earlier this year the coins Gamestop is holding for this purpose?
