So I have a question.

How would the boarder market/index's/exchanges/ETFs respond in price if more and more shares of stock are being direct registered?

My thoughts are if other stocks ,not just GME, are being direct registered wouldn't that draw share liquidity out of options? Lowering the leverage and cash value of the option/future contract markets.(calls/puts wouldn't move price as much). Shorts would find it harder to cover with options or manipulate price. Would that explain "SOME" of the downward trend of the market since the beginning of the year?

How would one calculate a total % of all market shares in direct registration of all publicly traded companies? Or a DRS graph of the companies in the S&P500; to see trends over the last year. Probably impossible unless you had a supercomputer. I don't know of any other companies that disclose DRS count in quarterly statements like GME.

Can institutions direct register? What about DarkCock? Is RC Ventures direct registered or is Ryan Cohen direct registered? I'm pretty sure LLCs can direct register if they own the shares out right. But institutions holding customers shares can not direct register for their clients? Not sure about the last part?

I'm just pondering ideas on how the markets would react if the "Everything Short" DD on super is correct. (I think that's the name).
