## String Theory and GME

Humans are destined to continue to evolve intellectually, and yet, string theory remains unsolved nearly 50 years after it was first thought up. Sure, we have CERN and the discovery of the Higgs boson in 2012, and another collider on the way, but why not put more resources toward the future of our people; why not try harder to continue to find better ways to thrive altogether? Why not, instead of hoarding all of it?

Okay, hear me out:

I was standing next to a parking meter on Olympic Blvd just having a look at it. I thought to myself about how humans are so gigantic relatively, that one perceives a parking meter as a solid object fixed there in relative space. Surely to us, it is there and it is hard and if I punch it it will hardly budge.

I noticed a few specs of rust on the top of the parking meter and focused on the big one in the middle. If we could shrink ourselves down so small that such a spec was like the size of LA, we would see that the parking meter isn't a solid object at all.

The really mind-bending part of this is that we perceive the parking meter as a relatively motionless object. In reality it's actually comprised of countless tiny things that are so ridiculously small and unfathomably close together and moving at such incredible speeds that in our reality based on our relative scale, we see a dang parking meter.

At that scale we would start to see how connected all these tiny things are. If we could take just one of these crazy tiny little things, and shrink ourselves down so that one of them was the size of LA, we would see that even these tiny little things, themselves, are comprised of shit-loads of even tinier little things!

This time, we would notice that these tinier little things are all exactly the same, except that they each move through space and behave in such a way that conforms with every single other one of them in existence throughout the universe, each of which to an extent relative to its proximity, relative to every other tiny little thing.

Everything behaves following the path of least resistance. Like a bubble, perfectly spherical because why do anything else?

Humans are matter, and so we too, are comprised of those same tiny, tiny, tiny little things!

If humans could reach their potential to manipulate strings' behavior, we could unlock abilities that would change the world forever; things like matter energy conversion and FTL propulsion, Zefram Cochrane and what not. Why not put more effort there instead of putting all the money in a big pile and just playing around with it all the time? Seriously, WTF are we doing?

Humans were once on an exponential path toward intellectually greatness, but at some point (I guess back in the 70's or whatever), we plateaued. With everything that has come to light over the past few years, I must wonder how many people long to find answers to the great questions of the universe, but lack the opportunity to truly pursuit that evolution for themselves and for the rest of us because of the greed of others.

Black swan please, because it's the right thing to do. Spread the wealth.

I just locked my keys in my car at a random gas station on Olympic and I don't have AAA.
