First, let me preface by saying I think this is a smoking gun...but I don't know enough to expand.

If you look at this graph:

[DTCC US Treasuries FTDs](<https://www.dtcc.com/charts/daily-total-us-treasury-trade-fails>)

I think it shows that they're naked shorting the US Treasury (how else would you FTD a treasury bond?)
\$40B FUCKING DOLLARS PER DAY (avg)

So, if you look at history...every major market crash is late September through mid October, which coincides with... The Federal fiscal year turnover! \[US gov't Oct 1-Sep 30\] Is the end of days going to be triggered in a few weeks because something in the Treasury cycle happens?

If you look at the example in the bottom of the DTCC link, you can add 3 zeros to it and see this is costing them MILLIONS to avoid GME mooning...

Anyone have a background in US Treasuries and the settlement cycles on overnight Reverse Repo and what 40B in FTDs daily means?
