I'm not getting in detail into any DD surrounding GME here and I'm in no way saying GME can't moon before it reached that mark or that it will moon for sure at that point. I'm also aware that institutions can buy or sell shares, reported short can go up or down but **as of today once there's 119 million Shares more DRSED and keeps increasing, the reported amount of shares sold short is proven to be wrong therefore supporting the DD surrounding this issue**.

Correct me if I'm wrong, but here's my thinking:

There's 304.516.136 shares outstanding, once you subtract Insiders, Institutions, Funds, ETFs and DRS there's only ~69(nice)million shares left. According to Morningstar they admit to having sold short ~50million shares.

So in conclusion once 50million + 69million = 119million more shares are DRSED, we are at the point where there's no denying that there are more synthetics floating around or is my thinking wrong?
