Title: Large short attacks are occurring at lower and lower thresholds: shorts are trapped under an ever-falling ceiling.

After the halts this morning, it is more apparent than ever that not only is there no way out for shorts, but that their margin (lol) for error is getting smaller and smaller.

There has of course been plenty of DD on this regarding GME critical margin lowering prices to levels that are tolerable, but I wanted to provide a nontechnical perspective on how much pressure we are exerting through continued DRS.

Think back to all of the massive short attacks we’ve seen since the sneeze, and notice how they all are 1) happening at lower prices and 2) less severe. We of course were shorted massively down from over 400 (pre-splividend numbers) in Jan 2021. Then we saw another enormous short attack at 350 in March, 330 in June, and 250 in Q4. In 2022 we’ve seen extreme resistance at 200, 180, and 150. This morning, we saw a huge attack at 130.

Any higher and shorts can’t meet margin, any lower and we DRS the float by New Year’s.

Shorts are losing control over price action and have fewer and fewer ways combat price spikes. We aren’t winning, we’ve won.
